STEAM TRAPS

ABOUT US

In 1916, the company, then known as the Sterling Engineering Company, began designing and manufacturing valves, traps, strainers and condensate pumps for steam and hot water systems.

Today, with more than 90 years of application experience, a diverse engineering staff, state-of-the art CAD design and thousands of custom applications, we are uniquely suited to meet your individual requirements and specifications.

STEAM TRAPS

OPERATING FUNDAMENTALS

Distributed By: M&M Control Service, Inc.

STERLCO THERMOSTATIC RADIATOR TRAPS (THE SMART TRAP) HOW THE STERLCO THERMOSTAT OPERATES

A. In a trap which is cold, or which is full of condensate below the boiling point, the Sterlco[®] thermostat remains compressed because of its internal vacuum. The trap is open and condensate flows out.

B. Whenever live steam strikes the bellows, the water inside the thermostat starts to vaporize or boil. As soon as the steam pressure inside the thermostat becomes almost equal to the steam pressure surrounding the thermostat, the spring action of the bellows causes it to extend itself and close the trap. Because the thermostat is filled with pure water, the relationship of inside and outside pressures is always the same. This trap will always pass condensate and hold back steam in spite of any variations in steam pressure.

If the thermostat is damaged, the vacuum inside will be lost and the trap will remain closed whether it is hot or cold. The location of the trouble will be easy to find because the radiator will be cold. Meanwhile, no steam is wasted.

STERLCO INVERTED BUCKET

www.mmcontrol.com/Sterlco.php

On start up, the bucket, by its own weight, rests on the trap bottom. The main valve is open, allowing the discharge of air and non-condensables. As condensate fills the body, it creates a seal on the open end of the bucket, which then becomes buoyant and rises, closing the main valve. Condensate, however, continues to enter the trap and force the air within the bucket out through the vent hole, causing it to lose its buoyancy and sink, opening the main valve to discharge. Condensate is discharged until steam reaches the trap and fills the bucket, which regains buoyancy and the operating cycle is repeated.

STERLCO FLOAT AND THERMOSTATIC

The Sterlco[®] F&T Trap contains a balanced pressure thermostatic air vent and main float operated valve for condensate removal. Air initially has free access to discharge until surrounded by high temperature which closes the vent. As condensate fills the trap body, the float rises, opening the main valve and discharging the condensate as it is received. The F&T is a fully modulating type trap that responds immediately or continuously to condensate discharge. The liquid level within the body is preset above the main valve, assuring that, when discharging, the orifice sees only liquid, thereby preventing the loss of live steam.

STEAM TRAPS

CONSTRUCTION

Trap bodies, covers, union nuts and nipples are close grained red brass castings. Accurate machining assures steam-tight fit and complete interchangeability of parts. Sterlco[®] low pressure traps, except 715-A, have valve cones of long-wearing tobin bronze and seats of brass. All others have stainless steel cones and seats for maximum resistance to high temperatures and abrasion. Stainless steel cones and seats are available for 1/2" and 3/4" LP traps.

STERLCO VACUUM THERMOSTAT FEATURES

- Bellows convolutions are formed under extremely high hydraulic pressure
- Smooth bellows surfaces means no tool marks where wear or corrosion can start.
- Multiple convolutions provide free travel of the valve cone. There is no danger of failures due to excessive bellows flexing.
- Vacuum charged...not charged at atmospheric pressure. The trap will close immediately if damaged.

THE STERLCO SMART TRAP

Will operate efficiently regardless of steam pressure variation. All thermostats and seats are replaceable without shimming or adjustment. Every trap is thoroughly tested. Components are inspected and tested during manufacture; completed traps undergo complete operating tests before shipment.

Angle Pattern 750 Series for low pressure; M-7 Series for medium pressure; 8 Series for high pressure

Straightway Pattern Provides minimum loss of height on horizontal piping

Vertical Pattern 780 Series for vertical piping and convectors

Corner Pattern 770 Series for low pressure heating. In right hand and left hand styles for convenient installation

* Available with tail pieces to reduce or increase "A" dimension by 3/8 inch.

Sterlco® thermostatic radiator traps accurately and efficiently free radiators of air and condensate... without allowing steam to be wasted into returns. They are especially effective on vacuum heating systems. Their simple design and rugged construction assure long, dependable service.

STEAM TRAPS

FOR EFFICIENT HANDLING OF LARGE AIR QUANTITIES AND WIDELY VARYING CONDENSING RATES

Sterlco[®] Float and Thermostatic (F&T) steam traps are preferred for efficient, economical vacuum and pressure service. F&T traps are highly recommended for applications where large volumes of air are present on start-up and where condensing rates can vary widely. F&T traps are ideal for service in health care institutions, apartments, educational facilities, offices and other public areas as well as in business and industry.

Choose from 21 standard capacity models, available in five connection sizes from 3/4" to 2". Float and Thermostatic steam traps are designed for ease of installation and simplified, minimal maintenance.

DEPENDABLE, TROUBLE-FREE FLOAT ACTUATION

F&T traps operate in response to rising and falling condensate levels and rising and falling temperatures near the thermostatic vent, as follows:

- Condensate initially fills the trap body to a predetermined level, which is sufficient to seal the valve seat opening.
- As the condensate level continues to rise, the float will rise causing the valve to pull away from the seat.
- Condensate will then be discharged into the return line through the trap outlet. The rise and fall of condensate level causes a continuous discharge which is typical of F&T traps.
- Air entering the trap is discharged through the thermostatic vent. The opening and closing of the vent is dependent upon the temperature surrounding the thermostatic element.
- As the element cools with more air accumulating, it opens to allow the air to vent to the atmosphere.

TYPICAL INSTALLATIONS

Install F&T traps in steam applications such as Instantaneous Heaters, Steam Humidifiers, Steam-Jacketed Vessels, Unit Heaters, Sterilizers and other similar equipment. Pictured at right are diagrams of typical installations.

STEAM TRAPS

INVERTED BUCKET (HORIZONTAL) OPERATING FUNDAMENTALS

TYPICAL DESIGN AND MATERIALS

This schematic presents materials commonly used in various components of Sterlco[®] Inverted Bucket Steam Traps. Information regarding materials in specific models is available upon request. All Inverted Bucket Steam Traps are constructed of cast iron with screwed connections.

APPLICATIONS

Sterlco[®] Inverted Bucket Steam Traps are commonly used wherever complete and rapid removal of condensate is essential. Specific uses include installation on steam systems serving autoclaves, steam mains, desuperheaters, stills, water heaters, sterilizers, cylinder or drum dryers and many other steam systems. Models for air systems are available also. Advanced steam trap designs can inlude optional items such as the integral strainer and air eliminator.

DESIGN FEATURES

Duo-Step Leverage: By using a relatively short trap lever with two fulcrum points, more power is developed to open the trap valve. This allows greater trap capacity without increasing trap size.

STERLCO RENEWABLE SEATS

All traps offer the economy of renewable seats, either screwed or pressed, greatly extending trap service life.

Guide Tube: Many models employ bucket guide tubes. Guide tubes assure precise parts alignment for improved operation. Buckets do not hit trap bodies, reducing wear. Condensate is directed to the bottom of the trap reducing water hammer damage.

OPTIONS

Air Eliminator: Effective trap operation is assured by using air eliminators to expel non-condensing gases that can build up inside the bucket.

Integral Strainer: Condensate is directed to the bottom of the trap and any dirt or scale in suspension will be trapped beneath the strainer screen. Periodic cleaning is accomplished by simply removing the drain plug and allowing sediment to drain from the trap.

Series 60: Pressures up to 250 psi

Series 19: Pressures up to 200 psi

Series 21-25: Pressures up to 250 psi

STEAM TRAPS

INVERTED BUCKET SIZING INFORMATION

GUIDES TO SELECTING THE PROPER STEAM TRAP SIZE

1. Determine the amount of steam condensate (per hour) to be handled by the trap. This information can usually be supplied by the equipment manufacturer, or the condensate amount can be determined by weighing it. Step-by-step formulas for calculating hourly condensate amounts are available upon request.

2. Determine the differential pressure. This is the supply pressure or maximum steam operating pressure, less any back pressure in the return main. If discharged into a vacuum, the amount of vacuum would be added to the operating pressure. (Note the various Differential Pressures listed in the DIMENSIONS & DISCHARGE CAPACITIES TABLE)

3. Determine the trap capacity factor. A steam trap's listed "continuous discharge capacity" indicates the pounds per hour of condensate that can be discharged by a trap when the trap valve is wide open. For all the bucket trap models described in this catalog section, continuous capacities are presented in the DISCHARGE CAPACITIES TABLE provided.

However, to select the correct size trap for a specific application, it is important to know that steam traps do not operate continuously in the wide open valve position. To compensate for this, a variable "factoring number" must be applied.

For example, if you have determined that your equipment will discharge condensate at 900 pounds per hour, this 900 figure must be multiplied by a factor of 2, 3, 4, 5 or 6, depending on the type of equipment being trapped. The Table of Factors presented here provides the proper factoring information.

EXAMPLE

Condensate to be Handled: 900 lbs. per hour Type of Equipment: Steam Mains Equipment Factor: Multiply by 4 Factored Condensate: 3600 lbs. per hour

TABLE OF FACTORS

| Blast Coils 3 | -4 |
|------------------------------|-----|

DETERMINING TRAP CAPACITY AT REDUCED PRESSURES

Problem What is the rating of a Model 122 suitable for 200 lbs. operating pressure when operating at 70 lbs. pressure?

Solution Rating of a Model 122 at 200 lbs. operating pressure is 3700 lbs. per hour. Referring to the Reduced Capacity Table provided here, locate the 200 lbs. column and move down to the figure opposite the 70 lbs. line - where you locate the .64 factor. Using this .64 factor (3700 x .64), the Model 122 rating at the reduced pressure of 70 lbs. is 2368.

STEAM TRAPS

TYPICAL DESIGN AND MATERIALS

This schematic presents materials commonly used in various components of Sterlco[®] Inverted Bucket Steam Traps. Information regarding materials in specific models is available upon request. All Inverted Bucket Steam Traps are constructed of cast iron with screwed connections.

APPLICATIONS

Sterlco[®] Inverted Bucket Steam Traps are commonly used wherever complete and rapid removal of condensate is essential. Specific uses include installation on steam systems serving autoclaves, steam mains, desuperheaters, stills, water heaters, sterilizers, cylinder or drum dryers and many other steam systems. Models for air systems are available also. Advanced steam trap designs can include optional items such as the integral strainer and air eliminator.

DESIGN FEATURES

Duo-Step Leverage: By using a relatively short trap lever with two fulcrum points, more power is developed to open the trap valve. This allows greater trap capacity without increasing trap size.

STERLCO RENEWABLE SEATS

All traps offer the economy of renewable seats, either screwed or pressed, greatly extending trap service life.

Guide Tube: Many models employ bucket guide tubes. Guide tubes assure precise parts alignment for improved operation. Buckets do not hit trap bodies, reducing wear. Condensate is directed to the bottom of the trap reducing water hammer damage.

OPTIONS

Air Eliminator: Effective trap operation is assured by using air eliminators to expel non-condensing gases that can build up inside the bucket.

Integral Strainer: Condensate is directed to the bottom of the trap and any dirt or scale in suspension will be trapped beneath the strainer screen. Periodic cleaning is accomplished by simply removing the drain plug and allowing sediment to drain from the trap.

STEAM TRAPS

NOTES:

In 1916, the company, then known as the Sterling Engineering Company, began designing and manufacturing valves, traps, strainers and condensate pumps for steam and hot water systems.

Today, with more than 90 years of application experience, a diverse engineering staff, state-of-the art CAD design and thousands of custom applications, we are uniquely suited to meet your individual requirements and specifications.

STERLEO

00-876-0036 847-356-056

STERLCO[®] PRODUCTS INCLUDE:

• HAND RADIATOR VALVES • THERMOSTATIC TRAPS • FLOAT AND THERMOSTATIC TRAPS

• INVERTED BUCKET TRAPS • CAST IRON STRAINERS • BRASS STRAINERS • BOILER FEED UNITS

• TANK AND PROCESS TEMPERATURE CONTROL VALVES • CONDENSATE PUMPS
